Beyond Herpetological Academics: History, Biographies, Memoirs, Outreach, and Other Interests

C. Kenneth Dodd, Jr.

You might think research scientists had enough to do with planning, conducting, analyzing, and writing up the results of research projects, teaching, public service, seminars and conferences, and seemingly endless administrative duties, not to mention a home life, to keep them occupied. Despite these responsibilities, however, many professional scientists have gone beyond the workplace to write about the history of their profession or specialty, biographies of colleagues past and present, memoirs of their own careers and adventures, popular outreach print media, and other subjects that have interested them that may be far from herpetology, natural history or even outside the realms of science. To date, there has not been a compilation of these efforts, and the following bibliography seeks to recognize the efforts of herpetologists, regardless of their professional affiliation, in these often related but extracurricular undertakings.

In preparing this bibliography, the following criteria have been used:

- The emphasis is on individuals who have focused on the biology of amphibians and reptiles as a career. Some have spent their entire lives as herpetologists, whereas others were herpetologically-focused for part of their career before venturing off to other pursuits. Contributions of amateur naturalists and herpetoculturists, journalists, nature entertainers, and science writers are not included, although they have frequently made important contributions to understanding the natural history, status, and problems facing amphibians and reptiles.
- As indicated in the title, the subjects of this compilation include herpetological history, biographies, personal memoirs, popular outreach (especially involving amphibians and reptiles), and non-academic interests of herpetologists.
- The focus of the bibliography is on books, booklets, and extended pamphlets. Journal articles and popular articles are not generally included, except when written as major monographs (e.g., when extensive institutional histories were published as part of a museum or society journal series).
- Biographies are generally limited to books. Shorter biographies of herpetologists have been published by Adler (1989, 2007, 2012, 2014), Rieck et al. (2001) and Bischoff (2018, 2024) – [all on herpetologists from German-speaking countries], Rossolimo and Dunayev (2003; herpetologists from Russia and the former Soviet Union), and La Vigni (2013; mostly European workers). Important biographies are also available in *Forwards* for authors of books covered in the series *Contributions to Herpetology* and *Facsimile Reprints in Herpetology* published by the Society for the Study of Amphibians and Reptiles (see Moriarty et al. 2024 for a complete listing). Biographies associated with obituaries as published in professional journals are not included.
- Children's books are not included unless they were written by a herpetologist.
- The editions listed below are from the United States unless otherwise indicated.
- I have added the non-English titles of publications originally published in English.
- Boy Scout Publications. A number of herpetologists have authored pamphlets in the Reptile Study Merit Badge series, initiated in 1927, published by the Boy Scouts of America. Authors include William Hassler, Roger Conant, Whit Gibbons, and Gary Stolz. Information on these publications is provided by Moriarty (2012), and they are not included in the bibliography below.

Finally, it is sometimes difficult to place a fine line between what is a book published for a professional audience and one for a more general audience. Some “popular” books contain extensive information that may be of considerable interest to professional herpetologists. As such, whether a book is included or not

may appear arbitrary, and to some extent it is. This bibliography is not likely the final word among herpetological bibliophiles. It is intended to highlight some of the non-purely academic or herpetological contributions of our colleagues past and present, and to make others in our profession more aware of the diversity of such contributions.

COMMUNISM and SCIENCE

by DR. FRED R. CAGLE

The Communists have identified, and are developing, those areas of knowledge most useful in competition with the free world. A leading Tulane scientist, who has personally seen the Soviet system at work, defines the challenge and suggests some of the things the United States must do to meet it.

THE COMMUNISTS have challenged us to a competition in the application of knowledge to win world dominance. Essentially this is a competition between two widely different forms of government. The United States is the leader of one team; the Soviet Union the leader of the other. The Communist team is prepared to use any device—aggression, subversion or “salesmanship.”

Both groups have used scientific knowledge to gain fearful weapons. Barring accidents, the “balance of terror” will continue until a system of world law is established. If so, the competition will be won by that system appearing to offer the best standard of living to the most people in the shortest period of time. We are in grave peril of losing this contest. The Soviets have identified precisely those areas of knowledge most useful in the struggle. They have chosen to place primary emphasis on science and technology. They give the development of science and technology priority over other activities of party and government.

My objective is to suggest some of the ways in which the Soviets have developed science and applied it in the competition with the free world.

The Communists have coldly recognized that they must take a number of actions to insure that the sciences produce the knowledge desired. These include:

1. *The education of the masses to an appreciation of the need for science and technology.*
2. *The production of increasing numbers of well-trained scientists and technicians.*
3. *The establishment of favorable working conditions for scientists and the creation of special rewards for scientific competency.*

ALL THESE they have achieved. Each Soviet citizen has an opportunity to gain an education. He has no alternative but to learn much science. Advanced education is provided to those judged eligible. Scientists are among the best paid persons; exceptional research and teaching is given great recognition. Research scientists are provided abundant technical assistance and adequate facilities. Scientists occupy leading roles in both party and government. Much of the planning is initiated at the scientist's work bench; he has much flexibility in his choice of problems. An information system provides the scientist with current knowledge of the work of his foreign colleagues.

AND WHAT are the results of these actions?

1. *The Soviet citizen supports the government decisions to place priority on science and its application, to reward scientists, to develop heavy industry, to orbit a satellite—at the expense of a more rapid increase in their standard of living.*
2. *An enormous and competent group of scientists are producing new knowledge in both fundamental and applied sciences.*
3. *The new information is being rapidly put to work by a corps of technologists, management specialists, propagandists, diplomats and politicians.*
4. *And of far greater importance, there is a trend toward increasing dominance of creative man over the party hack and the cynical party politician.*

THE SOVIETS use scientific knowledge in many ways. New information is rapidly applied. The success of their efforts in space, in automation, crop development, conservation, and surgery are diverse measures of their forced-draft introduction of new concepts.

Fundamental science is well supported because of anticipated long range applications or merely because problems exist. Distinguished Soviet scientists have recently estimated future developments. Some of the extensions of their research suggest these events in the 21st century:

A. N. NESSMAYANOV, PRESIDENT, SOVIET ACADEMY OF SCIENCES: *The plant will be bypassed. Artificial foods superior in quality will be manufactured.*

I. P. BARDEN, VICE PRESIDENT, SOVIET ACADEMY OF SCIENCES: *Metallurgy—We will change the structure of atomic nuclei and produce matter equivalent to the ores of rare elements.*

V. A. ENGELHARDT, DEPARTMENT OF BIOLOGY, SOVIET ACADEMY OF SCIENCES: *Animals and plants will be moulded to man's interest through rearrangement of the structure of genes and chromosomes.*

M. G. ANANIEV, INSTITUTE OF EXPERIMENTAL SURGERY: *The solution of biological incompatibility will permit routine replacement of body organs.*

L. A. ZENKEVICH, PROFESSOR OF INVERTEBRATE ZOOLOGY, MOSCOW UNIVERSITY: *A new science—marine agronomy—will be born. Sea mammals will be domesticated.*
